## VIKING (diagram)

The basic element is the module

with brackets constituting a bicycle wheel holder and it can already be a parking lot attached to the ground.

Depending on your needs, we can screw it to a wall or other vertical surface. If we equip this element of a bicycle rack with two symmetrical supports on the left and right side, we will obtain an independent structure in a vertical position. Next, we can screw it to hard surfaces (using the mounting foot) or concreted (then equipped with an anchor for concreting). In case we need more places in our bicycle rack, we use a connector between the spans. This increases the number of parking spaces for two-wheelers.

Therefore, the modular design of the Viking bicycle rack used by us significantly reduces the final price of the product, facilitating its transport and storage. Basic modules can be combined into parking lots for 6, 9 and more stations.
